# Федеральное государственное автономное образовательное учреждение высшего образования «Научно-образовательная корпорация ИТМО»

Факультет программной инженерии и компьютерной техники Направление подготовки 09.03.04 Программная инженерия

## Отчёт по лабораторной работе $\mathbb{N}4$

По дисциплине «Бизнес логика программных систем» ( семестр 6)

Студент:

Дениченко Александр Р3312

Практик:

Бобрусь Александр

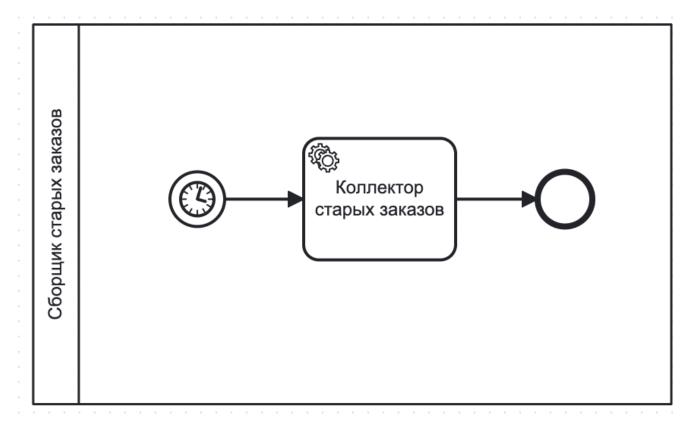

#### Данные

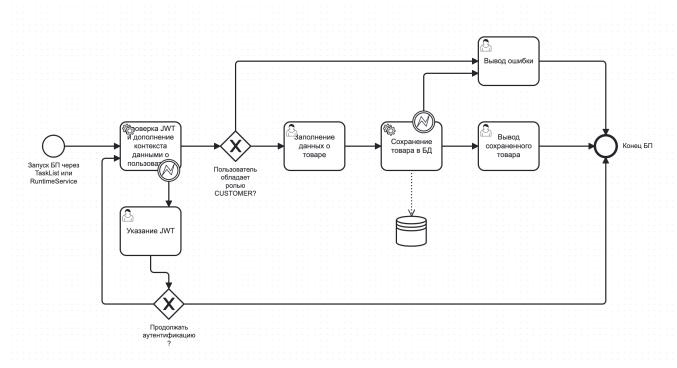

Переработать программу, созданную в результате выполнения лабораторной работы #3, следующим образом:

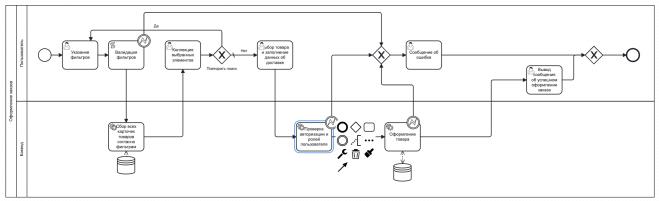

Для управления бизнес-процессом использовать BPM-движок Camunda. Заменить всю "статическую" бизнес-логику на "динамическую" на базе BPMS. Весь бизнес-процесс, реализованный в ходе выполнения предыдущих лабораторных работ (включая разграничение доступа по ролям, управление транзакциями, асинхронную обработку и периодические задачи), должен быть сохранён! BPM-движок должен быть встроен в веб-приложение (embedded mode). Для описания бизнес-процесса необходимо использовать приложение Camunda Modeler. Пользовательский интерфейс приложения должен быть сгенерирован с помощью генератора форм Camunda. Итоговая сборка должно быть развёрнута на сервере helios под управление сервера приложений WildFly. Правила выполнения работы:

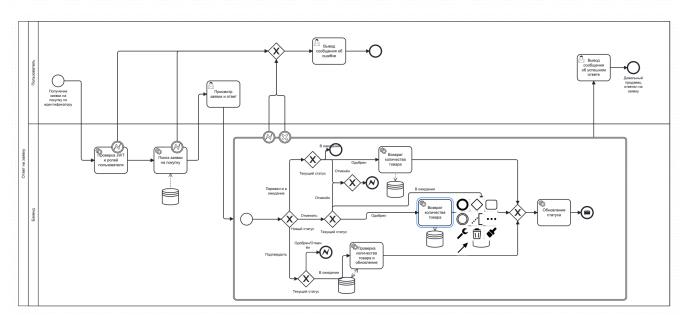

Описание бизнес-процесса необходимо реализовать на языке BPMN 2.0. Необходимо интегрировать в состав процесса, управляемого BPMS, всё, что в принципе возможно в него интегрировать. Если какой-то из компонентов архитектуры приложения (например, асинхронный обмен сообщениями с помощью JMS) не поддерживается, необходимо использовать для интеграции с этой подсистемой соответствующие API и адаптеры. Распределённую обработку задач и распределённые транзакции на BPM-движок переносить не требуется.

#### Выполнение

Делегаторы
